

UHE Cosmic Ray Energy  
Spectrum from the Telescope  
Array Experiment  
&  
Search for Simultaneous Showers  
in High Resolution Fly's Eye Data

**Douglas Chase Rodriguez**

February 15, 2011  
Ph.D. Defense  
University of Utah

# Outline

- Cosmic Ray Physics
- Overview of HiRes and Telescope Array
- Energy Spectrum
  - Analysis
  - Results
  - Summary
- Simultaneous Showers
  - Theory and Modeling
  - Analysis
  - Results
  - Summary

# Cosmic Rays

- 1912: Victor Hess discovers cosmic rays
- Observed over wide range of energies
- Slope barely deviates over 10 orders of magnitude
  - power law of -3
  - primary feature: the Knee ( $\sim 5 \times 10^{15}$  eV)

# Cosmic Ray Energy Limit

- 1964: Penzias and Wilson observe Cosmic Microwave Background (CMB)
- 1966: end of the cosmic ray spectrum proposed
  - Greisen and, independently, Zatsepin and Kuzmin

- GZK cutoff at  $6 \times 10^{19}$  eV (reaction threshold)
  - due to UHECR proton interacting CMB Radiation

K. Greisen. End to the cosmic-ray spectrum? Phys. Rev. Lett., 16(17):748–750, Apr 1966.

G. T. Zatsepin and V. A. Kuz'min. Upper limit of the cosmic-ray spectrum. Sov. Phys. JETP Lett., 4:78, 1966.

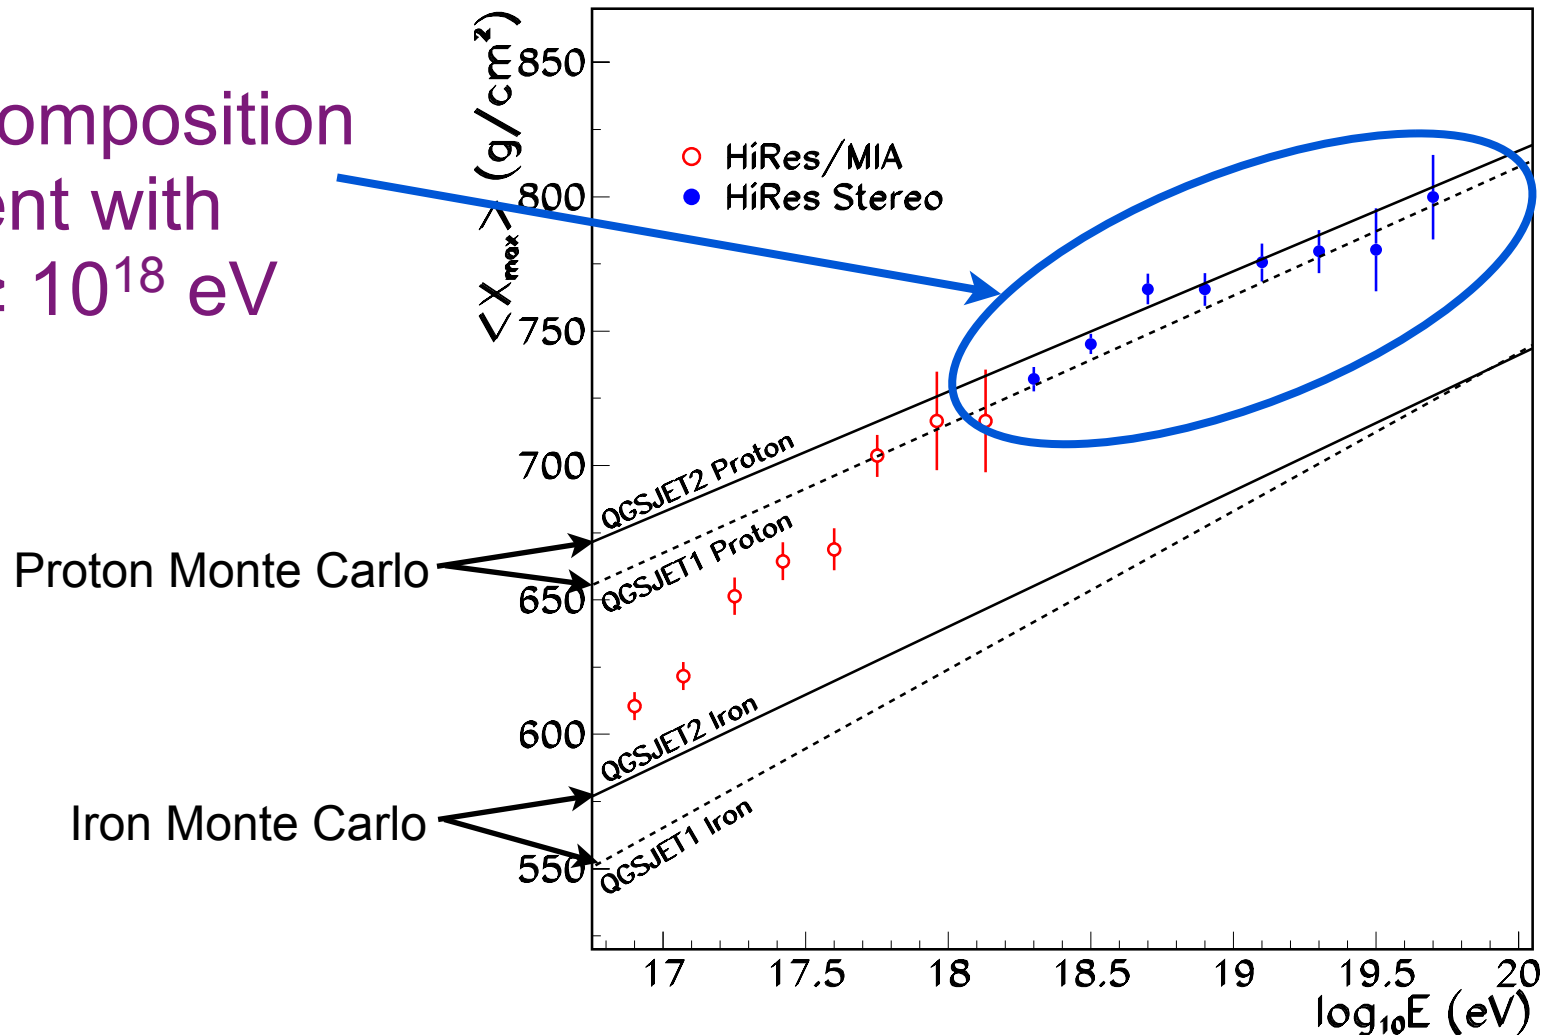

# UHE Cosmic Rays

- HiRes (Utah) first to observe GZK
- Ultra-High Energy (UHE) regime
  - $E \gtrsim 10^{17.0}$  eV
  - Flux  $\times E^3$
- Two features
  - ankle and GZK indicative of protonic composition

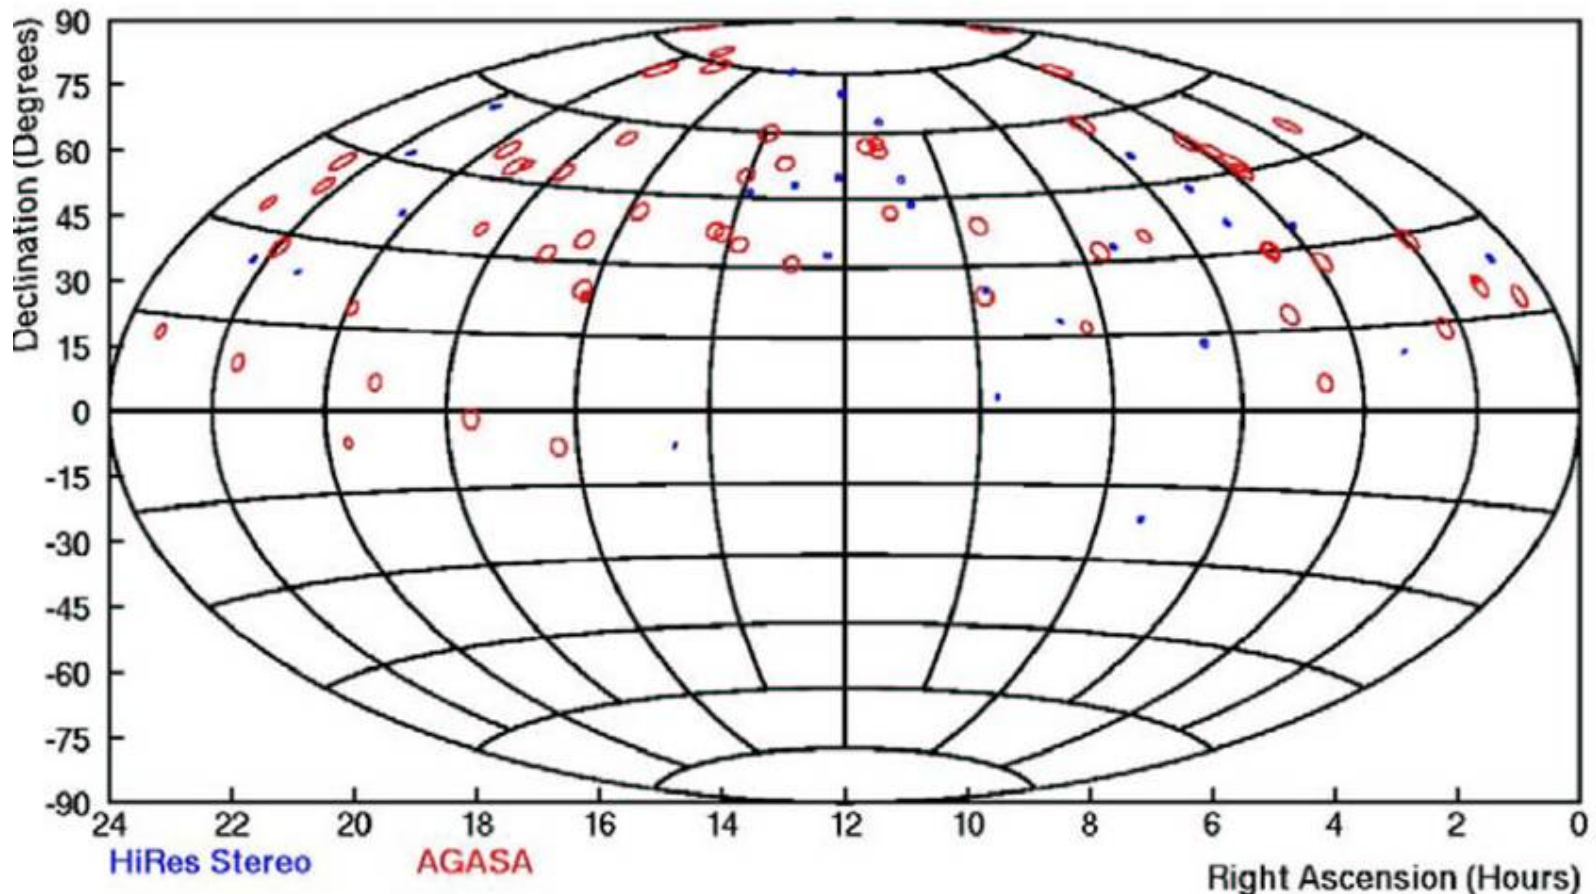

# UHE Cosmic Rays Composition

- HiRes composition consistent with proton  $\geq 10^{18}$  eV

- energy spectrum → acceleration mechanism?
- composition → where does acceleration taking place?
- current results: UHECR extra-galactic protons(?)
- anisotropy search → no significant results
- **Source is unclear**

68% Angular Resolution for AGASA and HiRes Events  $> 4 \times 10^{19}$  eV

# Observation of UHE Cosmic Rays

- Very rare
  - **Can't make direct measurements** using satellite- or balloon-sized instruments
- Detection method is conventionally known as **calorimetry**
  - Measure energy deposited into atmosphere
- Methods:
  - **Fluorescence telescopes**
  - Ground arrays (scintillators, water tanks, etc.)
  - Čerenkov detectors

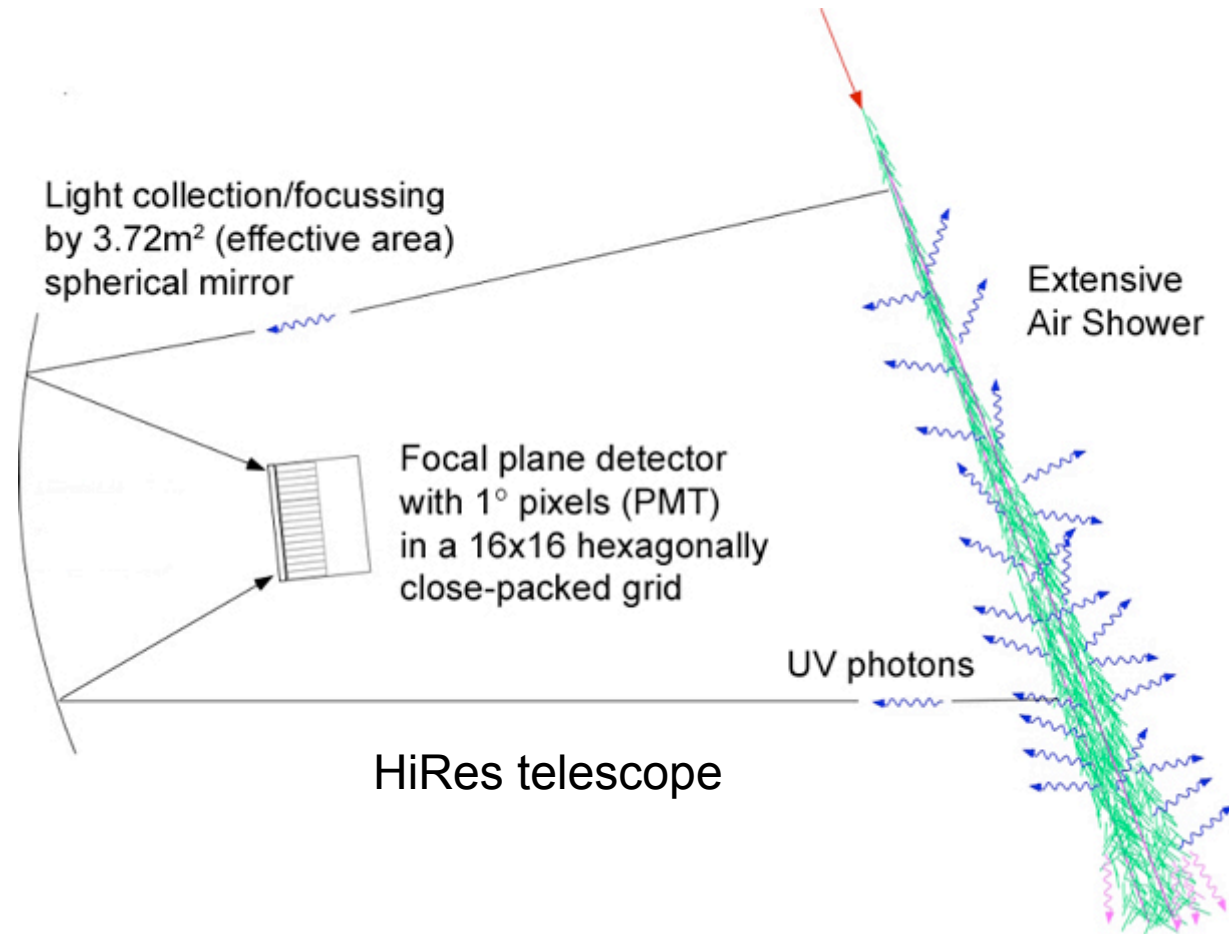

# Extensive Air Showers

- Primary particle enters atmosphere interacting with a **nucleus**, creating many secondaries
- Which go on to collide, **repeating interaction**, resulting in extensive air showers
- shower dominated by **electromagnetic particles** ( $e$  and  $\gamma$ ) after first few interactions

# Fluorescence Observation

- Fluorescence telescopes observe the UV light
- Consist of:
  - mirror focuses light
  - camera of photomultiplier tubes, convert light to electrical signal
  - UV bandpass filter removes most visible

# HiRes Sites

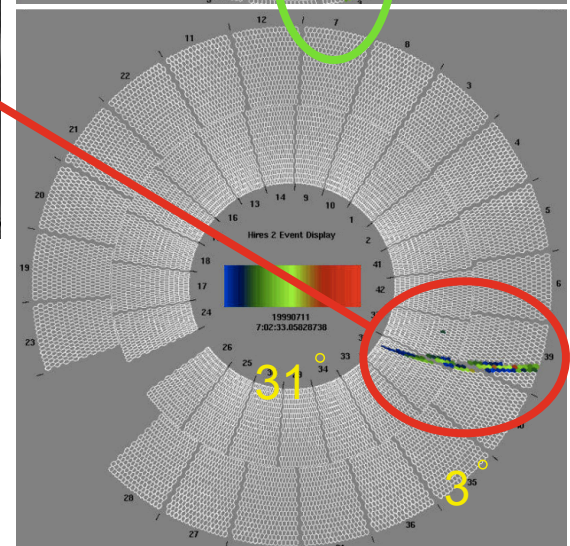

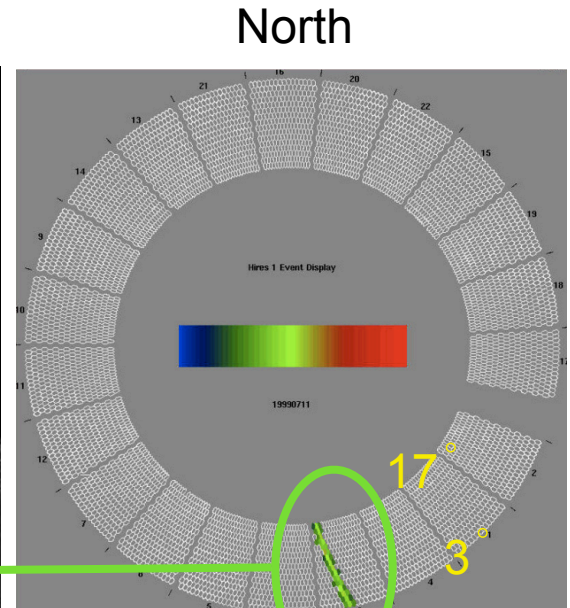

HiRes-1: atop Little Granite Mountain  
20 telescopes, “ring-1”  
( $3^\circ < \text{elevation} < 17^\circ$ )  
2 “ring-2” telescopes for stereo  
( $17^\circ < \text{elevation} < 31^\circ$ )  
Sample-and-hold electronics  
(pulse height and trigger time)

HiRes-2: atop Camel's Back Ridge  
12.6 km SW of HiRes-1  
42 telescopes, 2 full rings  
( $3^\circ < \text{elevation} < 31^\circ$ )  
FADC electronics  
(100 ns period)

# Stereo Observation

- Event Displays at right
  - Outer ring at  $3^\circ$  above horizon
  - Zenith is at center of displays
  - Color indicates intensity of light

# Observation of EAS

(playback at 1/500,000 speed)

HiRes-2 Event

# Observation of EAS

(playback at 1/500,000 speed)

# Reconstruction of EAS

1.)

- Trajectory can be determined in two ways:
  - 1 If observed by both sites, intersect the two Shower-Detector Planes
    - provides more precise geometrical (hence, energy) reconstruction
  - 2 Else, use the arrival time of light at the detector

2.)

# Measuring the Energy

Gaisser-Hillas:

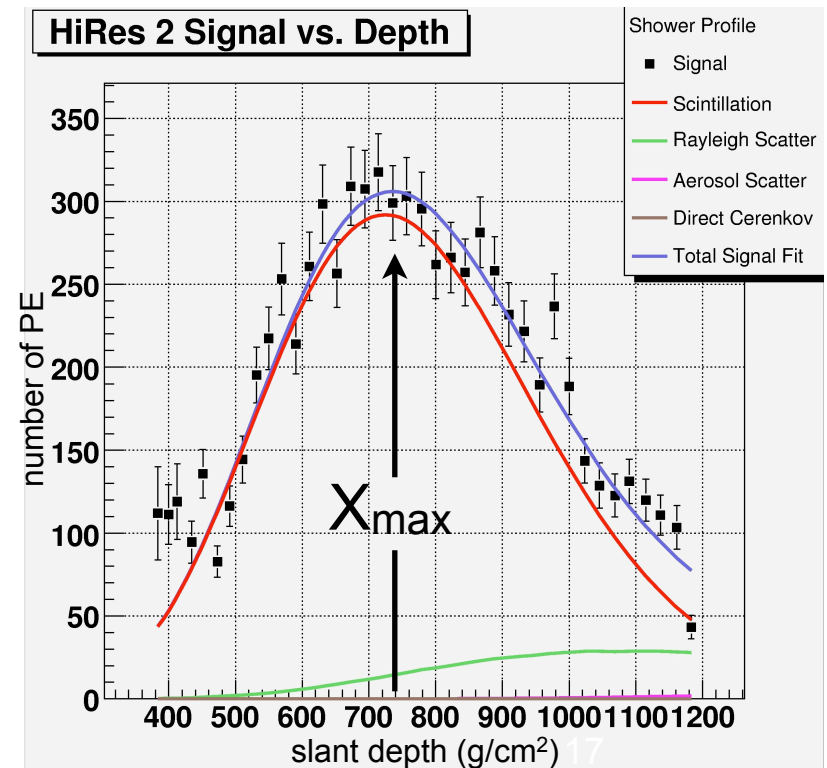

$$N(X) = N_{\max} \left( \frac{X - X_0}{X_{\max} - X_0} \right)^{\left( \frac{X_{\max} - X_0}{\lambda} \right)} \exp \left( - \frac{X_{\max} - X}{\lambda} \right)$$

## *Event by event:*

- $X_{\max}$  in  $\text{g}/\text{cm}^2$
- Total energy of the primary particle
- Arrival direction

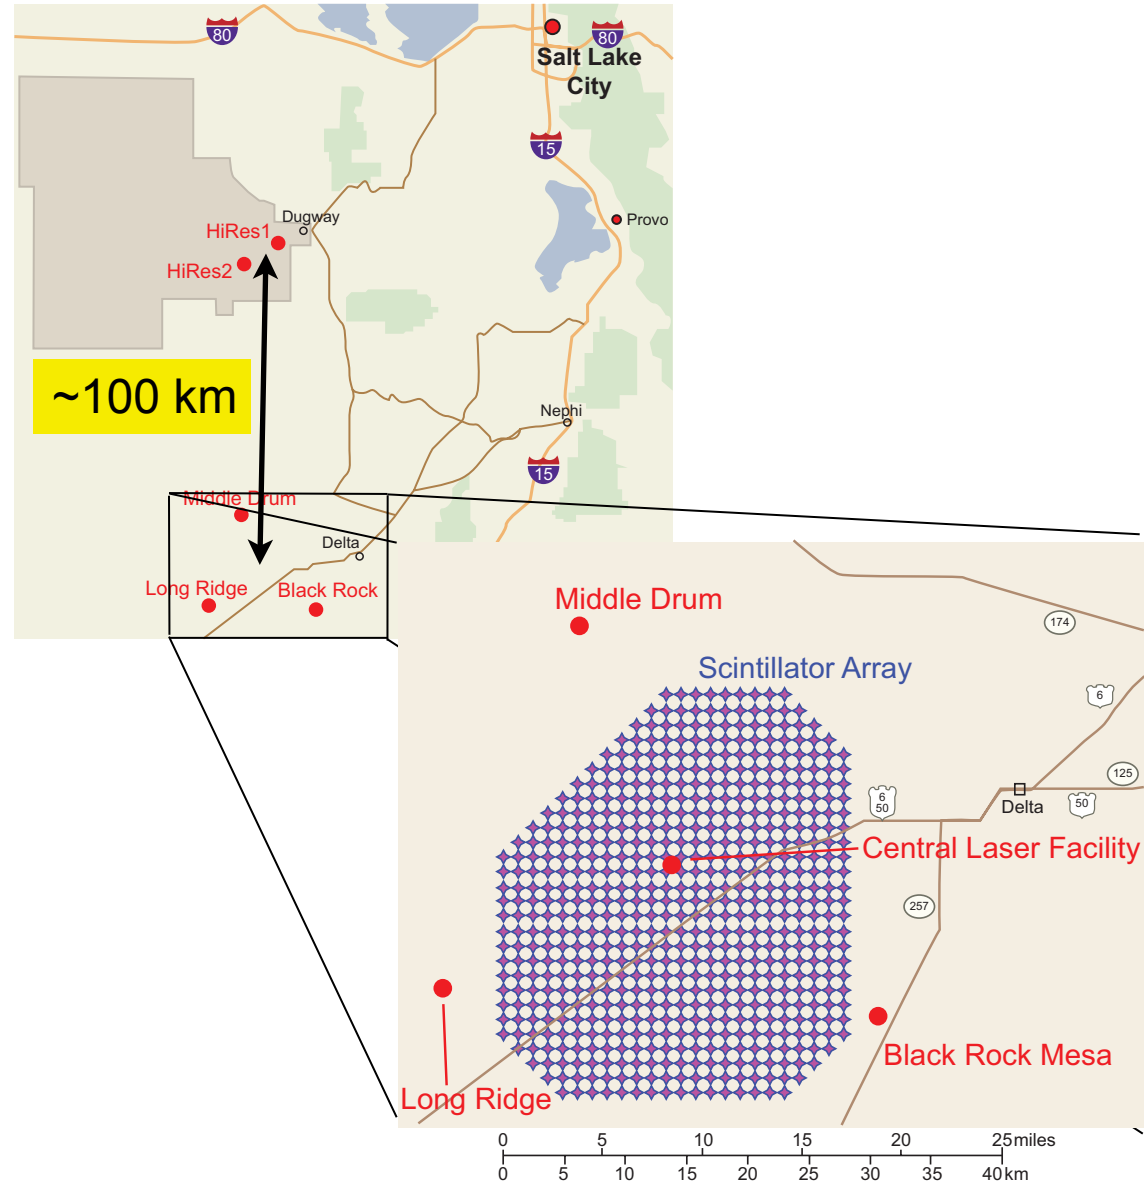

## *Statistically:*

- composition
- $p$ -air inelastic cross-section
- flux

# New Experiment: Telescope Array

- HiRes concluded operations 4/2006
- Collaboration between HiRes and AGASA groups

# TA Author List

# Physics Goals of Telescope Array

Observed	HiRes	AGASA	Auger
GZK	✓		✓ ✓
Point Sources		✓	
AGN Correlation			✓
Proton Composition	✓		
Iron Composition			✓

# TA Surface Detectors

- Scintillation Array
  - 1.2 km separation, square grid
  - $\sim 7\times$  AGASA area

# Surface Detectors

- 3 m<sup>2</sup> x 1/2 inch
- 2 layers
  - embedded, wavelength-shifting fibers
  - 1 PMT / layer

# SD Deployment

- Sept. 2006 - March 2007
  - 485 of 507 deployed

# TA Fluorescence Detectors

- 3 HiRes-like fluorescence detector sites
  - Black Rock Mesa

$10^{19}$  eV range

# TA Fluorescence Detectors

- 3 HiRes-like fluorescence detector sites
  - Black Rock Mesa
  - Long Ridge

$10^{19}$  eV range

# TA Fluorescence Detectors

- 3 HiRes-like fluorescence detector sites
  - Black Rock Mesa
  - Long Ridge
  - Middle Drum

$10^{19}$  eV range

# Middle Drum FD

- 14 telescopes refurbished from HiRes-1
  - Reduced cost
  - Quick construction
- Changes
  - 2-rings (3-31° in elevation) like HiRes-2
  - longer tracks
  - ~120° in azimuth

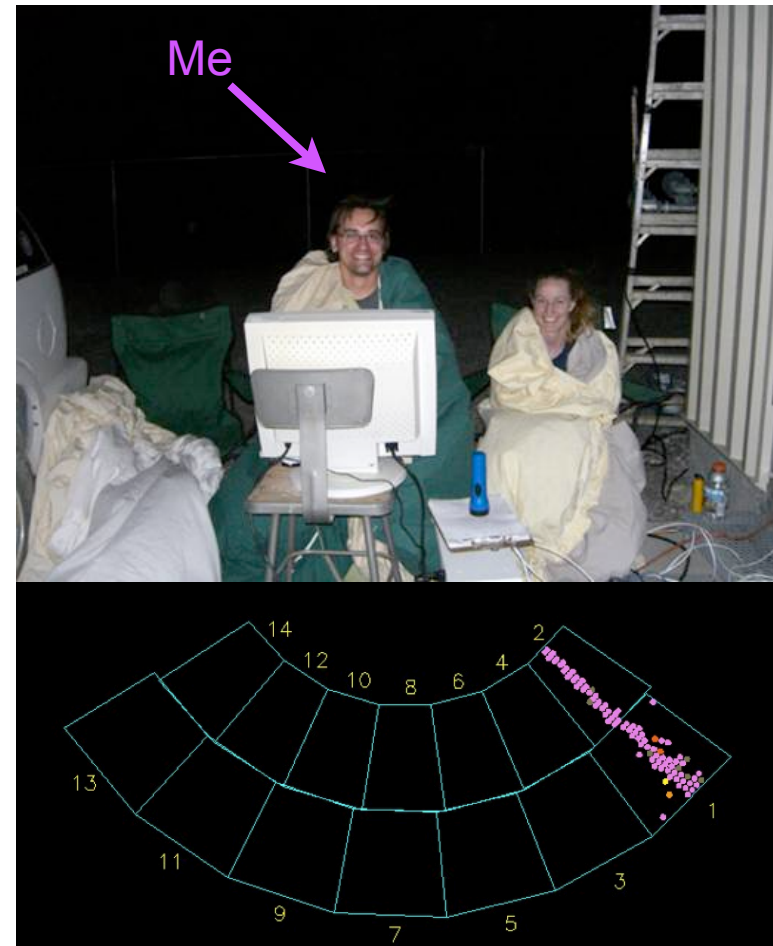

# Middle Drum FD

- Sample-and-Hold electronics
  - 5.6  $\mu\text{s}$  gate
  - “floating” tube thresholds to maintain individual firing rate of  $\sim 200$  Hz
- 256 PMT cameras
  - $1^\circ$  pixel
  - UV bandpass filter
- Same equipment used at HiRes-1
  - same calibration
  - direct link between HiRes-1 and Middle Drum

# Refurbishment

- I led a team of 3 students
  - 1 junior grad
  - 2 undergrads
- Process took 7 months, 2006-7
- Installation from June 2007 - October 2007
- Routine operations from November 2007
- First laser events shown at July 2007 ICRC (Mexico)

# Middle Drum 3-Year On-Time

- 1-year spectrum shown in 2009 ICRC (Poland)

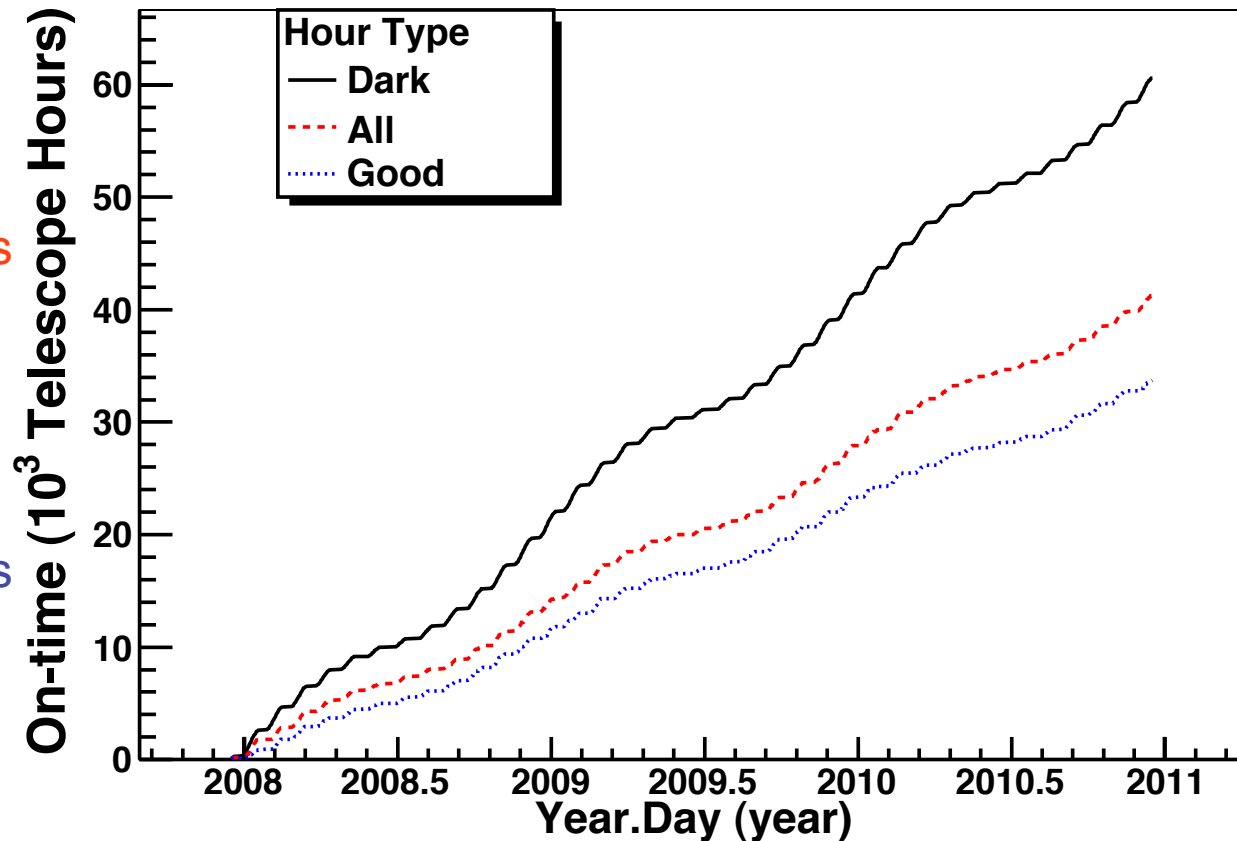

- December 16, 2007 – December 16, 2010

- All Weather: 41,261 integrated telescope hours
  - ~2,947 site hours (~68% of available)
  - moonless nights

- Good Weather: 33,686 integrated telescope hours
  - ~2,406 site hours (~82% of collected)
  - clear, moonless nights

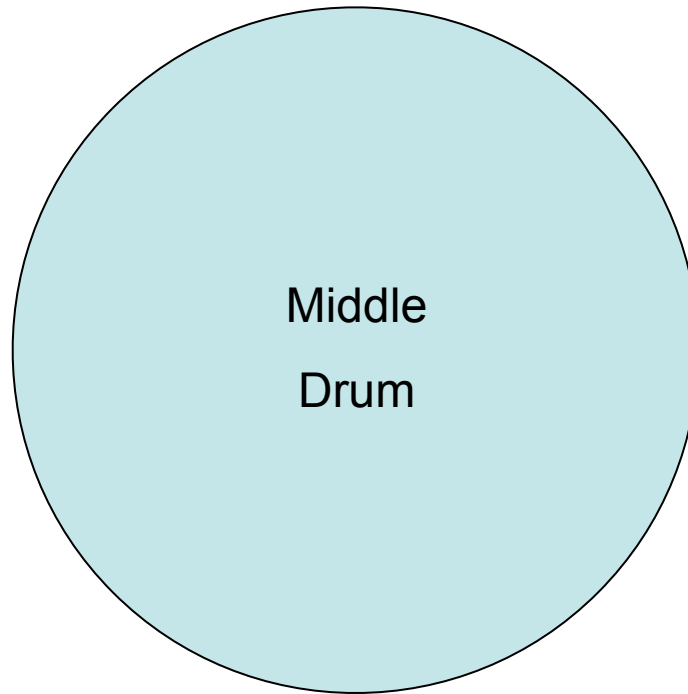

- ~9% duty cycle

TAMD Monocular On-time

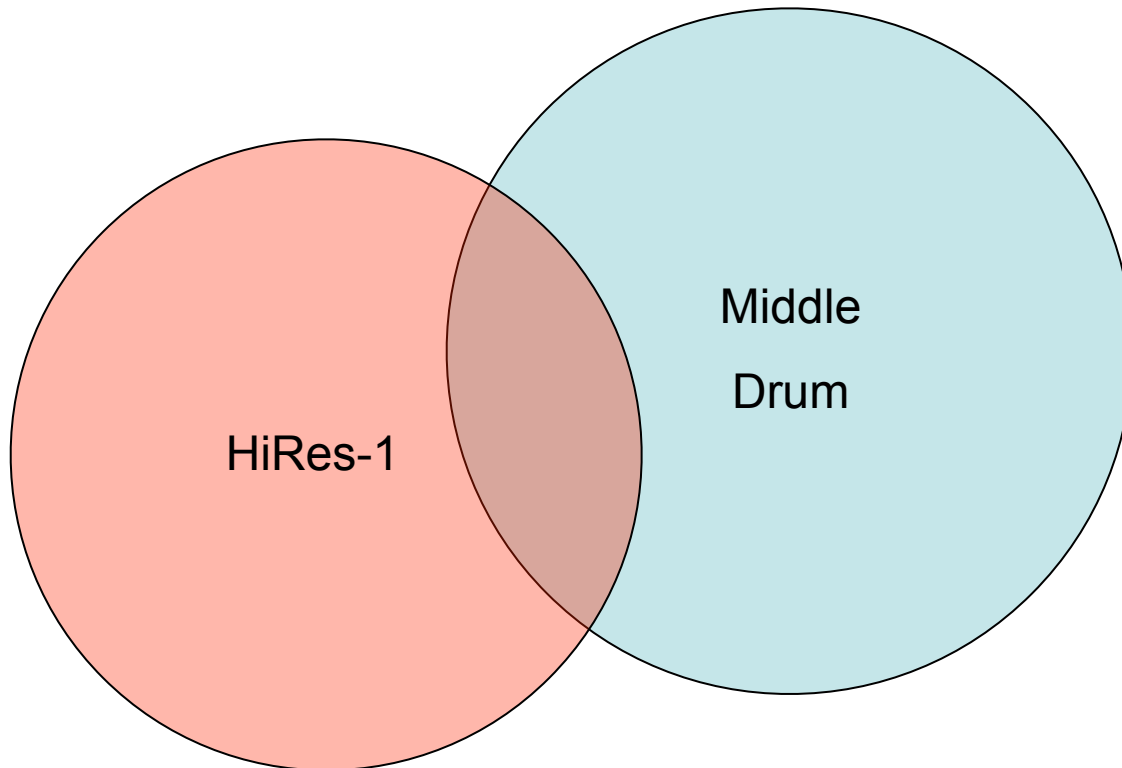

# My Spectrum Goals

- Produce a spectrum

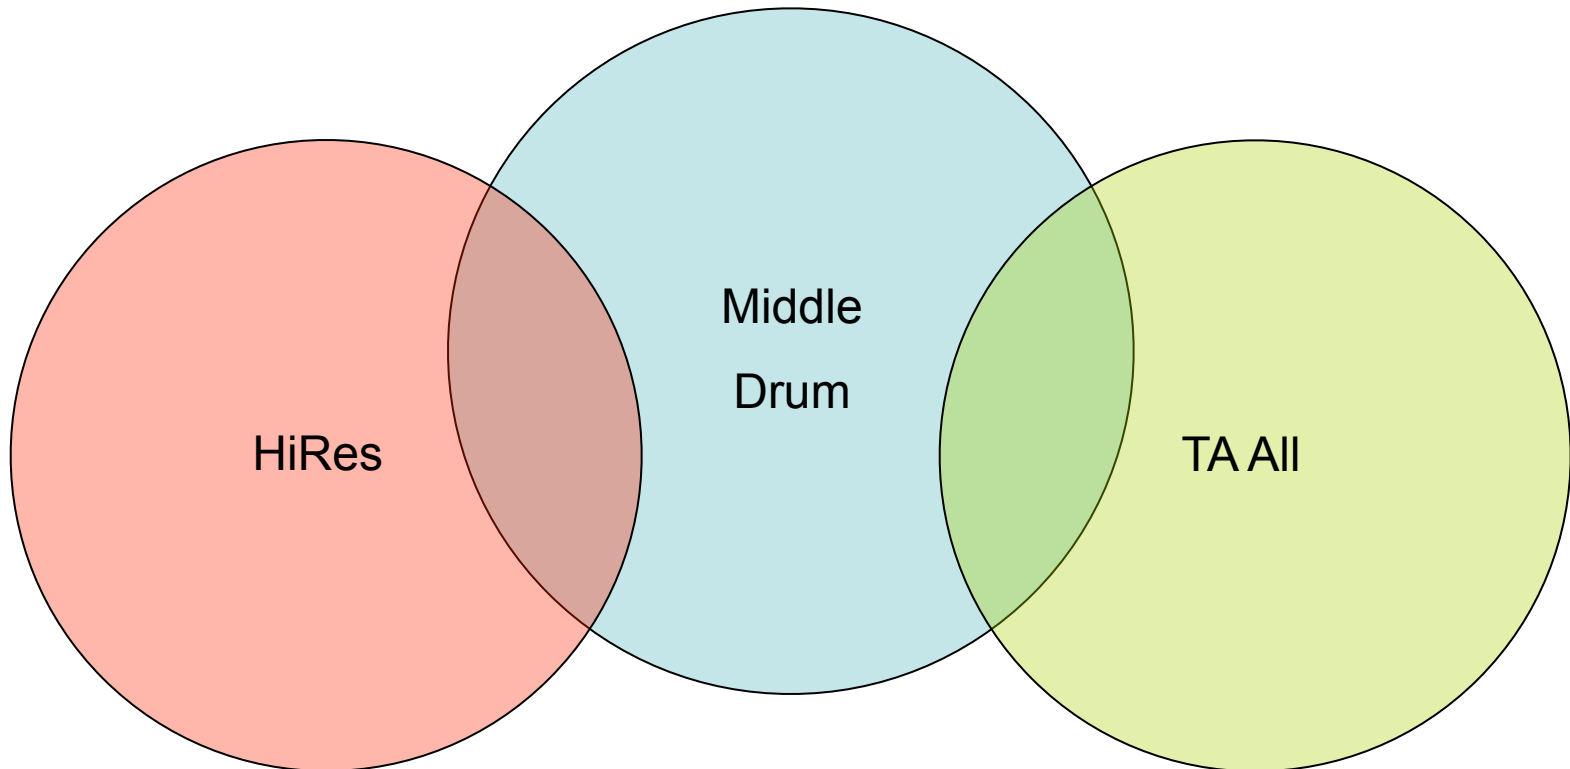

# Goals

- Transfer spectrum energy scale of HiRes-1 to TAMD

# Goals

- Lay groundwork for TA energy scale

# Calculating the Spectrum

- Energy spectrum is the **flux** of particles as a function of energy

$$J \text{ (m}^{-2} \text{ s}^{-1} \text{ sr}^{-1} \text{ eV}^{-1}\text{)} = \frac{N}{(A\Omega) \Delta t \Delta E}$$

- Need:
  - **number of particles** at each energy
  - detector **on-time**
  - **aperture**
- Use 1/10<sup>th</sup>-decade energy bins in spectrum
  - 10<sup>19-19.1</sup> eV, 10<sup>19.1-19.2</sup> eV, 10<sup>19.2-19.3</sup> eV, etc.

# HiRes-1/TAMD Event Selection

- **Most events from lasers**
  - CLF
  - Lidar at Black Rock
- Removed through GPS time-stamps

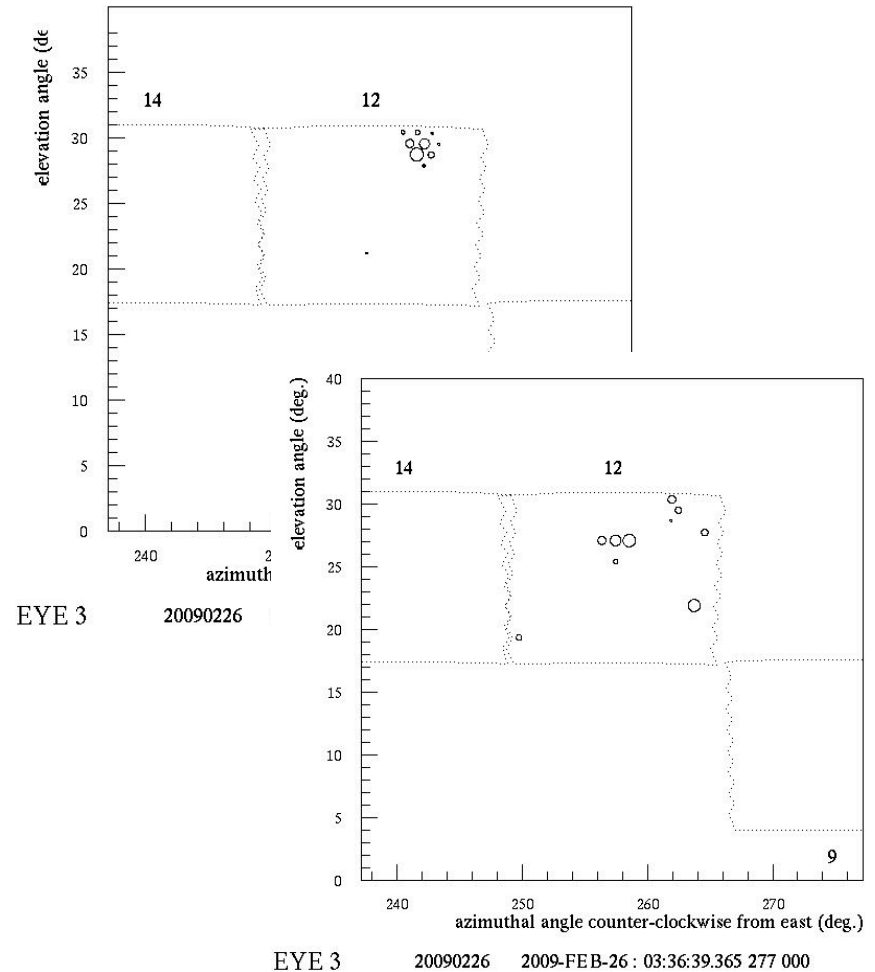

EYE 3

20090226

2009-FEB-26 : 04:29:57.000 350 000

# Noise Removal

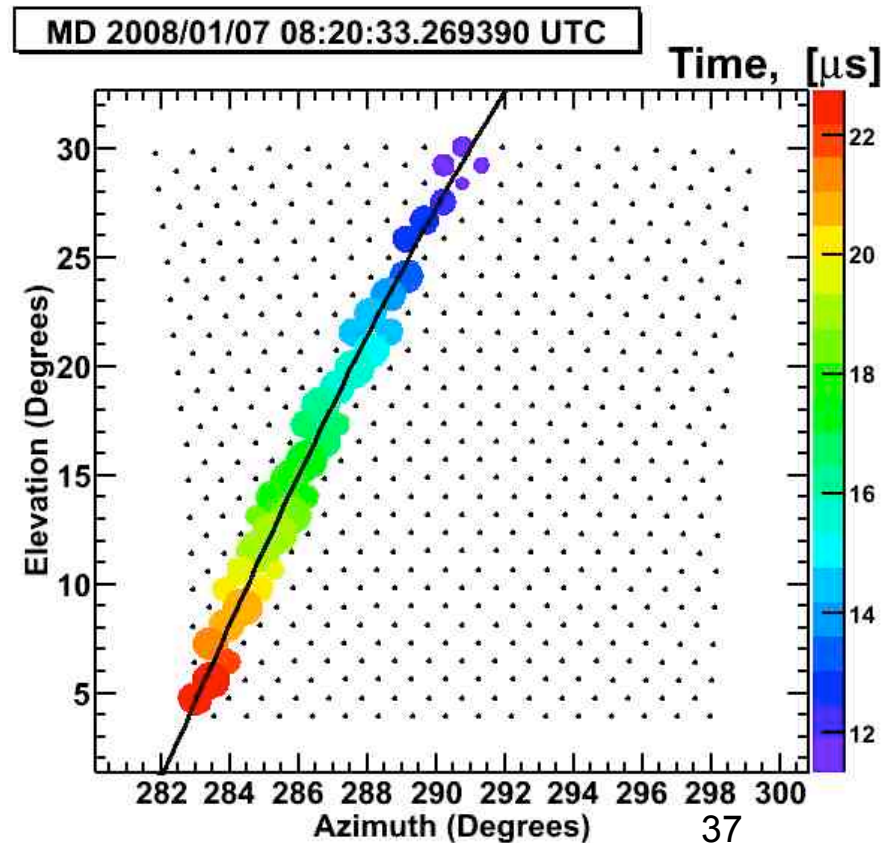

- Most remaining events are
  - Airplanes
  - Noise
- Removed using a Rayleigh Filter
  - Looking for time-ordered, line-like structures
  - Removes events with high random-walk (e.g. airplanes, noise)

# HiRes-1/TAMD Event Selection

Circle area  $\propto$  signal size

Fit survivors to a plane

# Profile-Constrained Timing Fit

$$t_i = t_0 + \frac{R_P}{c} \tan \frac{\theta_i}{2}$$

Better resolution,  
aperture

$$N(X) = N_{\max} \left( \frac{x - X_0}{X_{\max} - X_0} \right) \left( \frac{X_{\max} - X_0}{\lambda} \right) \exp \left( \frac{X_{\max} - x}{\lambda} \right)_{38}$$

# HiRes-1/TAMD Quality Cuts

After fitting, **Reject** events **IF**

1. Track “angular length”  $< 7.9^\circ$ 
  - Not long enough to determine a good geometry fit
2. Depth of first observed tube ( $X_F$ )  $> 1000 \text{ g/cm}^2$ 
  - The shower starts too deeply into the atmosphere
3. Effective mirror area correction factor  $< 0.9 \text{ m}^2$ 
  - Most of the light must be observed away from the mirror edge or tube edge
4. In-plane angle ( $\Psi$ )  $> 120.0^\circ$ 
  - Rejects events with large Čerenkov contamination

MD 2008/01/10 02:10:50.561935 UTC

Time vs Angle

MD Core Position

Shower Profile

Used in Spectrum

# TAMD Resolution

- **Quality assurance**
  - how well can we reconstruct the events
- MC resolutions of reconstruction variables
- 3 energy ranges
  - $10^{18.0} - 10^{18.5}$  eV
  - $10^{18.5} - 10^{19.0}$  eV
  - $> 10^{19.0}$  eV

$$\ln(R_{P\text{-Recon}} / R_{P\text{-Thrown}})$$

# $\Delta\Psi$

$$\ln\left(\frac{E_{\text{Recon}}}{E_{\text{Sim}}}\right)$$

- Energy Resolution ~20%
- Comparable to bin size

# Events Collected

- Number of TAMD events  
~1/3 HiRes-1 total

$\log_{10}$ Energy (eV)	HiRes-1	Integrated HiRes-1	TAMD	Integrated TAMD
18.05			974	3721
18.15			703	
18.25			530	
18.35			415	
18.45			272	
18.55	632	2473	222	827
18.65	416		173	
18.75	329		108	
18.85	288		79	
18.95	192		62	
19.05	168	616	55	183
19.15	131		41	
19.25	116		31	
19.35	72		20	
19.45	42		14	
19.55	37	87	13	22
19.65	19		4	
19.75	20		2	
19.85	8		2	
19.95	2		0	
20.05	1		1	

# Calculating the Spectrum

- Energy spectrum is the **flux** of particles as a function of energy

$$J \text{ (m}^{-2} \text{ s}^{-1} \text{ sr}^{-1} \text{ eV}^{-1}\text{)} = \frac{N}{(A\Omega) \Delta t \Delta E}$$

- Need:
  - **number of particles** at each energy
  - detector **on-time**
  - **aperture**
- Use 1/10<sup>th</sup> decade energy bins in spectrum
  - 10<sup>19-19.1</sup> eV, 10<sup>19.1-19.2</sup> eV, 10<sup>19.2-19.3</sup> eV, etc.

# Aperture

Aperture: effective area  $\times$  solid angle acceptance  
Use Monte Carlo simulation to calculate

$$(A\Omega)_0 \text{ (km}^2 \text{ ster)} = (2\pi) \pi R_{P\text{-max}}^2$$

$$(A\Omega) = (A\Omega)_0 \frac{N_{\text{Accepted}}}{N_{\text{Simulated}}}$$

# Monte Carlo Consistency Fix

- MC (blue) using HiRes-1 aerosol (VAOD) and thresholds
  - with TAMMD geometry
- Adjusted 2 values for HiRes-1
  - Atmosphere aerosol content
  - Tube gain/threshold
- Same desert, same aerosol content
- MC (red) using thresholds recorded from data at TAMMD
  - ~20% lower than at HiRes-1
  - fewer artificial light sources

# Data-MC Comparisons

- Use Data-MC comparisons to verify reliability of the aperture calculation
- 3 energy ranges are shown
  - $10^{18.0} - 10^{18.5}$  eV
  - $10^{18.5} - 10^{19.0}$  eV
  - $> 10^{19.0}$  eV
  - check energy evolution

Black points = Data

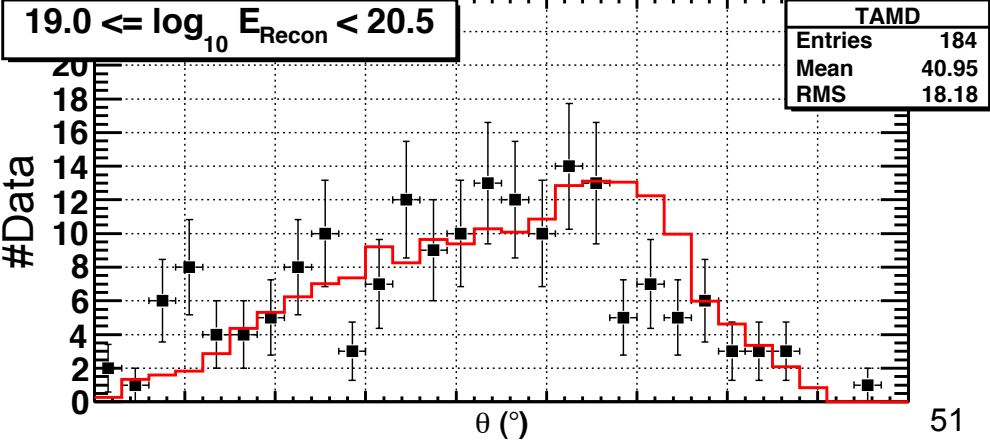

Red histogram = MC

Black points = Data

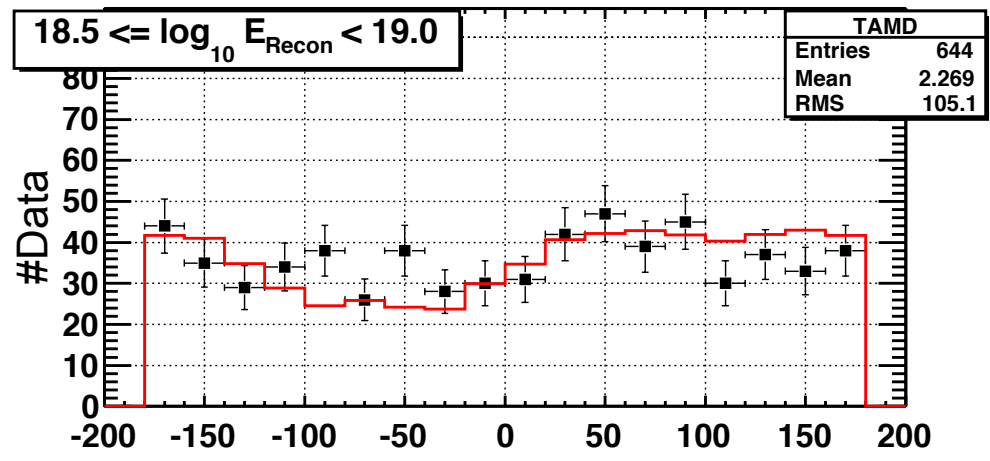

Red histogram = MC

Black points = Data

Red histogram = MC

# Exposure Difference

- High energy aperture  $\approx 1/2$  (HiRes-1):  $E > 10^{19}$  eV
- TAMD has  $\sim 1/3$  the exposure of HiRes-1

- TAMD 3-year energy spectrum in EXCELLENT agreement with HiRes in both **shape AND normalization**
- Indicates HiRes-I and TAMD have same energy scale
- Different energy scale would be reflected in change of normalization or shift of spectral features in energy - we see neither

# New Systematic Check of HiRes-I Energy Spectrum

- Studied effect of using the nightly atmospheric and electronic calibration databases on the data reconstruction
- HiRes-I published spectrum used
  - average atmosphere
  - average electronic calibration

- HiRes-I energy spectrum re-analyzed
- utilized every optometric calibration
- nightly atmospheric and electronic calibration database
- EXCELLENT agreement with previously published spectrum shows robustness with respect to most details of study

# Energy Spectrum Summary

- Measured energy spectrum from the TA experiment with first 3 years of MD data
- Direct link between TAMM and HiRes energy scales
- Good resolution over energy range of spectrum
- Excellent Data-MC comparisons
- No systematic bias using average atmosphere and electronic calibration

# Act II

## Exotic Event Search

# Cosmic-ray Heliospheric Interactions

- Hypothesis: hadronic decay in heliosphere produces...
- Neutral pion decay which...
- May be observable.

# Heliosphere

- Gigantic magneto-bubble
  - almost pure vacuum
  - holds only solar wind (+planets, etc.)
  - Limits effect of Interstellar Wind
- 3 areas of “high” concentration

# Heliosphere

Hydrogen Wall

# Heliosphere

Termination Shock

# Heliosphere

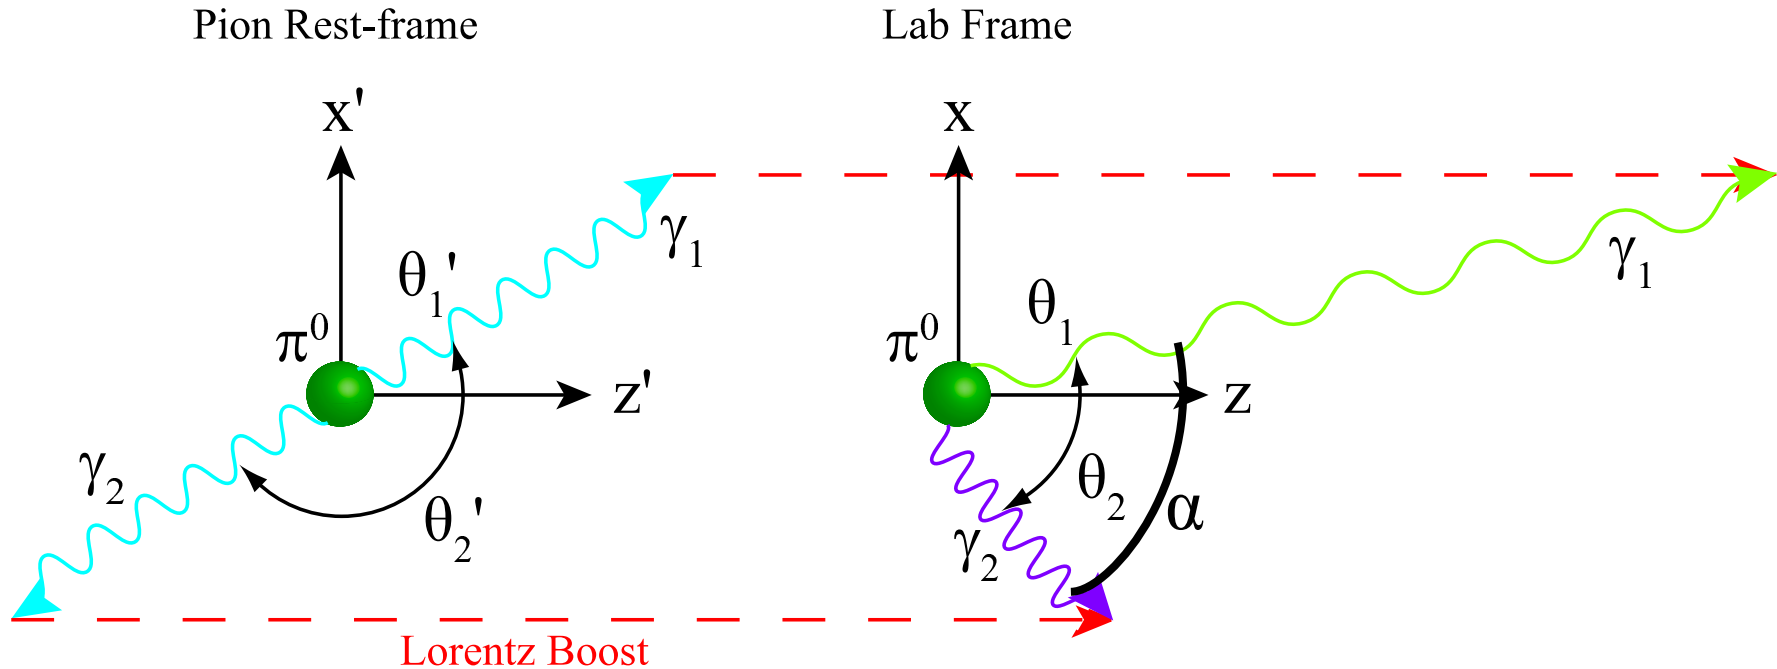

Heliosheath

# CR-Heliosphere Ion Interaction Probability

	Density (particle/ cm <sup>3</sup> )	Interaction Length (AU)	Region Thickness (AU)	Interaction Probability
Hydrogen Wall	0.3	$4.84 \times 10^{11}$	20	$1.08 \times 10^{-11}$
Termination Shock	0.1	$1.45 \times 10^{12}$	0.5	$8.98 \times 10^{-14}$
Heliosheath	0.001	$1.45 \times 10^{14}$	59	$1.06 \times 10^{-13}$

# Neutral Pion Decay

$$\cos \theta'_2 = -\cos \theta'_1$$

Use **relativistic kinematics** to convert  
from rest-frame to lab-frame

# Photon Opening Angles

$$\tan \theta_1 = \frac{P_{1x}}{P_{1z}} = \frac{\sin \theta'_1}{\gamma(\beta + \cos \theta'_1)}$$

$$\tan \theta_2 = \frac{P_{2x}}{P_{2z}} = \frac{\sin \theta'_2}{\gamma(\beta + \cos \theta'_2)}$$

$$\alpha = |\theta_1| + |\theta_2|$$

$\log_{10} E_{\text{pion}} \text{ (eV)}$	$\log_{10} \alpha \text{ (degrees)}$
17	$\sim -4$
21	$\sim -11$

# Perpendicular Spread

- Perpendicular spread between photons
- $R \sim 75\text{-}100 \text{ AU}$
- $\alpha \sim 10^{-4} - 10^{-11} \text{ degrees}$
- $L_{\perp} \approx R \alpha$

1 AU =  $1.5 \times 10^8$  km  
(Earth-Sun distance)

# Spread Between Showers

Minimum spread between showers gets narrower as pion energy increases

Pion Energy	Spread
$10^{17}$ eV	30,000 m
$10^{18}$ eV	3,000 m
$10^{19}$ eV	300 m
$10^{20}$ eV	30 m
$10^{21}$ eV	3 m

# Signature of $\pi^0$ -decay Double Showers

HR1 3808/04/29 08:26:48.000138 UTC

Monte Carlo  
simulation shows  
3 classes of events

Single Event,  
Single Telescope

Event = grouping of data

Multiple Telescopes

# Signature of $\pi^0$ -decay

## Double Showers

Monte Carlo

simulation shows

3 classes of events

Multiple Events

# Distinguishing Multiple-Event Showers

- MC: Colored Bands
- Data: Brown Points
- Photon times and energies
- Data inconsistent with simulated double-showers

# Single-Event Double-Shower Search

- Used **HiRes-I data** set since it is the largest available at the time this project was started
- Created **new programs** to search for two, simultaneous, time-coincident showers
- Modified the standard Monte Carlo to allow two showers to be within a single event

# Noise Removal

- Use Hough Transform to remove non-linear events
  - noise
  - airplanes
  - muons
- Used in computer image processing
- Utilized by R. Abbasi for anisotropy studies of HiRes data

# Line Quality

# Looking for Multiple Showers

- Group triggered tubes into clusters
  - trigger time within  $2 \mu\text{s}$
  - pointing angle within  $1.2^\circ$
- Determine shower-detector plane for each cluster

# Event Sorting

- Most remaining events are artifacts
  - HR2SLS
  - Flashers
  - Terra Laser
  - Inter-site Flasher
- Removed by
  - time-stamp
  - position
  - angle of trajectory
  - repetition

HiRes1

00013559

2005-JUL-08 : 05:50:14.222 097 366 UT

# Preliminary Double-Shower Candidates

SD Plane Normal Comparison: Y vs X

- Monte Carlo simulations uniformly distributed around detector
- Data had patterns

# Resolving Data Doubles

- Data events primarily correlated with known laser events with known time-stamps

# Resolving Data Doubles

- Known lasers had well-defined **zenith angles** or **inverse angular speeds**
- Removed **MC and data events** if **both** tracks have
  - inverse angular speed  $< 0.3 \mu\text{s}/\text{degree}$
  - zenith angle,  $\theta$ ,  $> 0.85$  radians ( $\sim 49^\circ$ )

# Final Double-Shower Candidates

SD Plane Normal Comparison: Y vs X

- 23 Data events remain
  - 46 clusters
- 82% MC retained

# Remaining Data Candidate Examples

Appears to be Single  
Shower where event  
crossed two telescopes

# Remaining Data Candidate Examples

Comprised of events where event crossed two telescopes

# Remaining Data Candidate Examples

HR1 2000/03/07 08:09:40.761690 UTC

Comprised of events where event crossed two telescopes

# Refining the Mean

- To obtain a refined mean, remove outliers
- Determine the mean separation in 2-dimensions

$$X_{\theta-jk} = \frac{\theta_{jk} - \bar{\theta}}{\sigma_{\theta}}$$

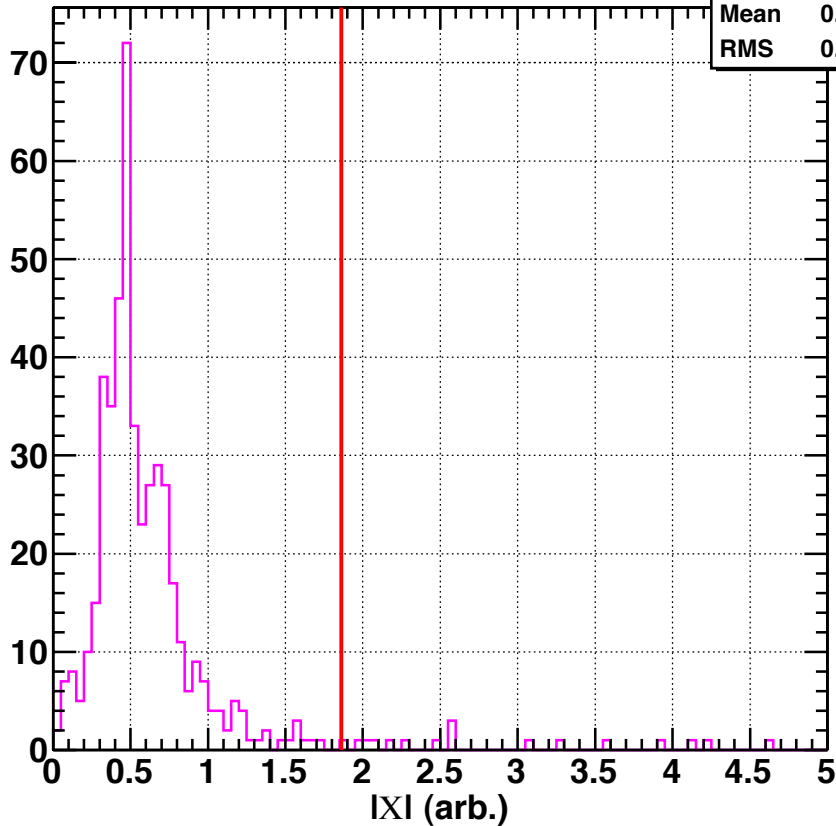

$$X_{r-jk} = \frac{r_{jk} - \bar{r}}{\sigma_r}$$

- Determine the difference between the individual points and the mean
  - Equivalent to the normalized RMS deviation

$$|X_{jk}| = \sqrt{X_{\theta-jk}^2 + X_{r-jk}^2}$$

# Cut Parameter

Shift in mean of cluster 2

normalized to the RMS error

distinguishes double- and single-showers

# Final Cuts

- Single-shower MC (5×data)
- Same processing/analysis

SDP difference  $|X|$  Means

To determine  
double-shower  
tracks: compare  
shift in Hough  
Means of cluster-2

1590 (57%)  
Double-shower  
MC events kept

# Final Double-Showers in the Data

SDP difference  $|X|$  Means

# Double-Shower Aperture

$\pi^0$  Observation Aperture

Spherical volume  
in which HiRes-I  
can observe  
double-showers  
from pion decays

# Summary

- Physics shows very unlikely scenario for cosmic-rays to interact heliosphere
- If they were to occur and both showers were able to reach Earth, HiRes-1 could have seen them
- **We saw no double-shower candidates**
- Further refinement will result in upper-limit publication
